THE REEL THAT EDITED ITSELF

AI Auto-Edit Reel Pipeline

You hit record. The machine does the rest — cut, caption-sync, hook card, export. Zero human editor. This is the exact architecture behind the reel you just watched. Steal it.

THE 5-STAGE PIPELINE

1 — Capture — talk, don't edit

Record one continuous take on a phone or DJI Osmo Pocket. No marks, no re-shoots. The raw clip is the only human input. Vertical `1080×1920` for reels, `1080×1350` for feed.

2 — Transcribe — word-level timestamps

Run `faster-whisper` locally (free, no API). It returns every word with a start/end timestamp. This is the spine — captions and cuts both snap to it.

3 — Auto-cut — kill the dead air

A script reads the transcript gaps + silence detection (`ffmpeg silencedetect`) and trims pauses, filler, and false starts. A 47s ramble becomes a tight 30s cut without anyone touching a timeline.

4 — Caption + hook — burned in, beat-snapped

Captions are drawn from the Whisper timestamps so they land on the exact word. The on-screen hook card (`"THIS REEL EDITED ITSELF"`) and brand strap are composited in one `ffmpeg` filter pass.

5 — Export — NVENC, one pass

Single render via `ffmpeg` NVENC (GPU) with libx264 fallback. Out comes a finished, platform-ready vertical. From record to publish-ready in minutes, not a 3am editing session.

THE STACK (ALL OF IT)

faster-whisper
Local transcription, word timestamps. $0.

ffmpeg
Cut, silencedetect, caption burn, NVENC export.

Claude Code
Orchestrates the steps + writes per-platform captions.

One script
Glues it: record in → finished reel out.

Don't want to build it? We'll wire it into your brand.

SkynetLabs builds AI content pipelines that produce on autopilot — so your team stops editing by hand and starts shipping daily. Same system, tuned to your voice and platforms.
